

AquaBiomics Microbiome Test Report

About this report

Generated on: Fri Oct 28 14:25:33 2022

These data provide detailed information on the community of microbes ([Bacteria](#) and [Archaea](#)) living in your aquarium. For this analysis we extracted DNA from microbes sampled from water and biofilm communities. Universal primers were used to amplify a genetic marker from this combined sample, and thousands of individual DNA molecules from this mixture were sequenced. Each sequence was then compared with public DNA databases to identify its origin.

This report summarizes the different kinds of microbes in your sample, and their relative abundance, with a special focus on beneficial and harmful microbes for the saltwater aquarium industry and hobby.

Information about the sample

Sample ID	1001577
Sample Name	S1000 OCT 22
Tank Name	S1000
Sample Date	10/4/2022 17:00

Diversity

This score is a measurement of the number of different types of Bacteria or Archaea in the sample. Read more about Microbial Diversity [here](#).

Diversity Score (Percentile)

176 (34)

Your sample was less diverse than at least half the tanks we tested. If you're interested in increasing this score, please see [these notes](#).

Balance

This score compares the microbiome in your tank with that of a typical reef tank. High scores indicate a typical community, while low scores indicate an atypical community. Read more about this score [here](#).

Balance Score (Percentile)

0.17 (24)

The composition of your tank's community is very different than most tanks we've tested. If you're interested in increasing this score, please see [these notes](#).

Community Composition

This figure shows the reasons for your balance score. Compare your sample with the typical community to identify families that are unusually high or low in your sample. Read more about the major families of microbes in reef tanks [here](#).

The size of each bar indicates the relative abundance of each microbial family, coded by color. For clarity, only the families accounting for at least 1% of either community are shown here.

Your sample showed differences in the relative abundance of one or more of the major microbial families, compared with the typical reef tank. Learn more about these families [here](#) or at the links below.

Higher than typical

[Alteromonadaceae](#)

Lower than typical

[Vibrionaceae](#)

[Rhodobacteraceae](#)

[Pelagibacteraceae](#)

[Oceanospirillaceae](#)

[Flavobacteriaceae](#)

Nitrifying Community

These communities include ammonia-oxidizing Bacteria (AOB), ammonia-oxidizing Archaea (AOA), and nitrite-oxidizing Bacteria (NOB). Although present at detectable levels in most tanks, there turns out to be more variation in the levels of these groups than many aquarists expected.
